Eventra — Professional Website Upgrade Report

Eventra — Professional Website Upgrade Report

Date: September 23, 2026 (updated September 24, 2026) **Scope:** Full HIGH + MEDIUM overhaul (10 items) plus all "nice to have" completeness items, as approved.

+ Addendum 3 — Jelly Animated Dashboard Hero (September 24, 2026)

> **Superseded by Addendum 4** — the standalone hero banner was folded into the full dashboard redesign below. `jelly-animated-hero.tsx` remains installed and reusable.

Integrated the **jelly-animated hero** template as a banner at the top of the Dashboard page:

- **`src/components/ui/jelly-animated-hero.tsx`** (NEW) — the FarmUI `FUIHeroWithJelly` component adapted to this stack:
  - **Next.js → Vite:** `next/image` → plain `<img>`, `next/link` → react-router `Link` (this project is Vite + React Router, not Next — the `next` dependency from the template's install list is intentionally not installed).
  - **Tailwind v3-safe classes:** `theme(colors.slate.300/.8)` → `rgba()`, removed invalid `min-w-screen` / `h-50`, fixed the duplicated `md:text-6xl`.
  - **`data-aos` attributes → Framer Motion** entrance fades (staggered 0.05/0.2/0.35/0.5s), respecting `prefers-reduced-motion`.
  - **Eventra branding:** gradient headline (indigo/violet instead of red/blue), "Explore events" CTA routing to `/events` with the animated double-arrow hover.
  - **Verified live assets:** the animated "jelly" background video (`ease-one.vercel.app/bg/something.mp4`, HTTP 206, plays 3840×2160) floats beneath a large Unsplash event photo (stage-lights audience, HTTP 200). All props (`headline`, `subtitle`, `ctaLabel`, `imageSrc`, `videoSrc`) are configurable.
- **`src/pages/Index.tsx`** — `<JellyHero className="mb-10" />` mounted as the first element inside the dashboard, above the stat cards.
- Verified in-browser: headline gradient, CTA hover animation, image + playing video, and the stat grid flowing correctly beneath the banner. `tsc`, ESLint, build and tests all clean.

+ Addendum 4 — Template-style Dashboard Redesign (September 24, 2026)

The Dashboard page (`src/pages/Index.tsx`) was rebuilt in the style of the shared FarmUI reference: **the animated "jelly" video is now the full dashboard background**, with dark glassmorphism cards floating on top:

- **Cinema panel** — a rounded black `<section>` with the jelly video (`ease-one.vercel.app/bg/something.mp4`, 4K) covering the whole area at 60% opacity under a gradient scrim + indigo ambient glow; autoplay has a pause-resume ref guard for webview compositing hiccups; disabled under `prefers-reduced-motion`.

- **Glass design language** — one shared `glass` class (`rounded-2xl border-white/10 bg-white/[0.05] backdrop-blur-xl shadow-2xl`) across 7 cards; white-on-glass text replaces the old theme-aware card styles on this page.
- **Hero header** — the "Manage your events, sales and analytics in one place." gradient headline, subtitle and "Explore events" CTA (with arrow micro-interaction) from the template now sit inside the panel.
- **Top stat row** — three glass stat cards (Total Revenue / Registrations / Events) with green/amber % pills (template style) and the existing count-up animation.
- **Balance panel** (template's "Total Balance" column) — Collected Revenue + gradient "View payments" CTA, plus Collected vs Pending totals with matching progress bars (real payment data).
- **Revenue Overview** — big glass chart card with **Daily / Weekly / Monthly / Yearly toggle pills** (template's exact control); each range re-shapes a smooth emerald area chart scaled to real revenue, with glassy tooltip and k-formatted Y axis.
- **Top Events column** (template's "Employee" column) — top 3 events by registrations with gradient bars, a **VIP/Regular ticket-mix bar**, and a registered-users summary.
- **Recent Activity** — re-skinned to glass with Paid/Pending/Success pills; unchanged data logic.
- Light mode note: this page intentionally stays dark (cinema panel) in both themes, like the template.
- Verified in-browser at desktop + mobile widths: video playing, tabs switching, bars/chart/feed all live. `tsc` clean, build ✓.

+ Addendum 2 — Live Revenue Fix (September 24, 2026)

- **`src/pages/Payment.tsx` + `src/pages/RazorpayCheckout.tsx`** — on payment success, the React Query caches for `stats`, `payments` and `registrations` are now invalidated, so the dashboard's Total Revenue and counts update immediately instead of showing stale numbers until a manual reload.
- **`scripts/build-preview.cjs`** — the preview demo's mock API was static (payments were ignored, so revenue never moved). It is now **stateful**: `POST /api/payments` adds a payment and increments revenue; registrations/events create + delete mutate the demo dataset too. Verified live: a ₹555 test payment moved Total Revenue 1841 → 2396, and a full register → VIP-pay flow moved it again (→ 2694) with registrations 8 → 9.
- Also fixed a mangled regex inside the builder template literal that had killed the entire mock shim (the root cause of the frozen numbers in the demo).
- Note: the server intentionally rejects a second payment for the same registration ("Payment already exists"), so re-paying the same ticket never adds revenue — that is correct business logic, not a bug.

+ Addendum — Intro / Loading Screen (ImageStreamHero corridor, scroll-to-continue)

> **Supersedes the earlier StackSpread intro** — `stack-spread.tsx` remains installed and usable as a scroll-driven section, but the intro now uses the corridor component below.

- Component placed at **`src/components/ui/image-stream-hero.tsx`** per shadcn conventions (`components.json` alias `ui` → `@/components/ui`). Copied essentially verbatim — it has **zero external dependencies** (pure React + CSS 3D keyframes; no motion, no hooks libs).
- **`src/components/IntroScreen.tsx`** — full-viewport intro hero: two mirrored rails of **event-themed Unsplash imagery** (concerts, conference, party, stage, DJ, workshop — all 8 URLs HTTP-200 verified) stream toward the viewer behind a readability scrim, the Eventra gradient logo, headline, tagline and a **"Get started"** CTA. A **"Scroll to explore"** cue with bouncing chevron sits at the bottom; scrolling (or the CTA) flows down to the dashboard, which lives directly underneath the hero in normal document flow — real scroll, no scroll-jacking.

- Plays once per browser session (`sessionStorage`); afterwards the dashboard is the first screen. `prefers-reduced-motion` freezes the corridor (built into the component) and disables the entrance animations.
- Mounted at the app root in `App.tsx`, wrapping the router + toasters.

✅ Verification Summary

Check	Result
TypeScript (`tsc --noEmit`)	✅ 0 errors
ESLint	✅ 0 new issues (2 pre-existing shadcn primitive warnings remain, untouched)
Production build (`vite build`)	✅ Succeeds (3.9s, 2865 modules)
Unit tests (`vitest run`)	✅ 1/1 passed
Serving smoke test	✅ index, `manifest.json`, `favicon.svg` all return HTTP 200

> ⚠️ **Environment note:** your machine had no Node/npm/bun on PATH and `node_modules` was installed from Windows (`win32-x64` native binaries). To run/build locally, run `bun install` (or `npm install`) once so bun/npm fetches the macOS `darwin-arm64` natives. I temporarily staged the correct darwin-arm64 natives (`@esbuild`, `@rollup`, `@swc/core`) to verify the build; a fresh `bun install` will replace them cleanly. `package.json` now lists `framer-motion ^12.23.12`, so one install brings everything in line.

🔴 HIGH PRIORITY (Visual Impact)

1. Landing-page decision honored → Dashboard stays at `/`, visually upgraded

As per your decision, **no separate landing page** was added. Instead the dashboard became the "hero" surface: gradient headline, live-data badge with pulsing dot, 4 animated stat cards, revenue trend chart, activity feed and highlights panel (see #2).

2. Dashboard Enhancements — `src/pages/Index.tsx`

- **Animated number counters** — new `src/components/AnimatedNumber.tsx` counts up with `easeOutCubic` on first scroll-into-view (Framer Motion `useInView`, respects `prefers-reduced-motion`).
- **Trend badges** — every stat card shows an ▲/▼ percentage with green/amber coloring and "vs last month" label (deterministic pseudo-trend derived from value; swap for real API data later).
- **Sparklines** — each stat card has a mini area-chart sparkline (Recharts) below the number.
- **Revenue trend line/area chart** — new dedicated card with gradient-filled area chart over the last 8 months, scaled to the real `totalRevenue`.
- **Recent activity feed** — merges latest registrations + payments into a unified timeline with icons, ticket type, payment status badges and hover highlights.
- **Highlights panel** — top event (from real chart data), upcoming events count, payment success rate.
- **Gradient page header** — "Dashboard **Overview**" with gradient text + live-data pulse badge.
- **Hover glow accents** — radial gradient blob fades in on card hover; icon scales.
- **Skeleton loaders** replace spinners for stats and charts.

3. Footer Component — `src/components/Footer.tsx` (NEW), wired into `Layout.tsx`

- Brand block (gradient logo + tagline), quick links (Dashboard/Events/Register/Payment), 4 social icon buttons with hover glow, copyright line with dynamic year, responsive column layout.

4. Header Upgrade — `src/components/Layout.tsx`

- **User avatar dropdown** (`src/components/UserMenu.tsx` NEW) — gradient-initials avatar, name/email header, Profile/Settings items (disabled placeholders), destructive-styled Sign out that clears auth and redirects to `/login`.
- **Notification bell** (`src/components/NotificationCenter.tsx` NEW) — provider + bell with unread count badge, popover panel with mark-all-read/clear, relative timestamps, persisted to `localStorage`, and an "all caught up" empty state. The dashboard now pushes payment-success notifications; Payment page pushes payment-completed ones.
- **Gradient active state** — active desktop nav item gets a gradient underline accent bar; signed-out users see a reduced public nav + "Sign in" gradient CTA button.

5. Event Card Redesign — `src/pages/Events.tsx`

- **Taller image (160px → 208px)** with title overlaid on the gradient scrim.
- **Seat progress bar** — availability meter with %, "Available"/"Filling up" state, and a 🔥 "Selling fast" ribbon at ≥80%.
- **Hover glow** — lift + gradient border + `shadow-elegant`, image ken-burns zoom.

🟡 MEDIUM PRIORITY (UX Polish)

6. Registration Stepper — `src/pages/Register.tsx`

- **3-step progress indicator**: ① Your Details → ② Ticket Type → ③ Confirm. Checkmark on completed steps, gradient glow on current step, animated connecting progress bars.
- Step 1 validates name + event before advancing; shows the **seat availability progress bar** for the chosen event.
- Step 3 is a review summary (attendee, event, ticket, venue, total) before submitting.

7. Event Filters — `src/pages/Events.tsx`

- Search input (title/venue, with clear button) + **category filter pills** with gradient active state, both derived from live data.
- "Load more" pagination (6 per page) with remaining count.

8. Skeleton Loaders — `src/components/Skeletons.tsx` (NEW)

- `EventCardSkeleton`, `StatCardSkeleton`, `TableSkeleton`, `ChartSkeleton` (bars mimic chart shape). Replaced spinners on Dashboard, Events and all four Admin tables.

9. Admin Table Enhancements — `src/pages/Admin.tsx`

- **Tab count badges** on all four tabs (live counts).
- **Row hover highlight** transitions on every table.
- **Per-table search boxes** (users by name/email; events by title/venue; registrations by user/event; payments by user/status).
- **Export CSV** on all four tables (respects current filter; BOM + quoting for Excel).

- **Colored status badges** — Paid/Confirmed/Completed = green, Pending = amber (shared `StatusBadge` component).
- **Bulk actions** — checkbox column on Events with select-all + "Delete (n)" bulk-delete mutation.
- **User avatars** (gradient initials) in the Users table; empty states with search/calendar icons.

10. Page Transitions — `src/App.tsx`, `src/components/PageTransition.tsx` (NEW)

- **Framer Motion installed** (^12.23.12). `AnimatePresence mode="wait"` wraps the router; every page fades + slides (0.3s, expo-out). Each page is wrapped in `PageTransition`; auth pages excluded via Layout passthrough. All animations respect `prefers-reduced-motion`.

🟢 NICE TO HAVE (Completeness)

11. Password Strength Meter — `src/pages/Signup.tsx`

- Live 5-segment meter (length, mixed case, digits, symbols) with labels Very weak → Very strong and color coding (rose/amber/emerald). Bonus: real-time "✓ Passwords match" indicator on the confirm field.

12. Brand Inconsistency Fixed — `src/pages/Login.tsx`, `src/pages/Signup.tsx`

- "EventFlow" → **"Eventra"** on both auth pages (login previously said EventFlow; signup said it in the subtitle too). Also renamed in `MockRazorpayModal.tsx` merchant name.

13. SEO Meta Tags — `index.html`, `public/favicon.svg` (NEW), `public/manifest.json` (NEW)

- Full meta suite: title, description, author, theme-color, Open Graph (site_name/title/description/type/image), Twitter card, **JSON-LD WebApplication schema**.
- **Custom SVG favicon** (gradient bolt) + apple-touch-icon.
- **PWA manifest** (standalone display, brand colors, icon).
- Inter font via Google Fonts with preconnect.
- **Per-page titles** via `src/hooks/usePageTitle.ts` → "Dashboard · Eventra", "Events · Eventra", etc. on all 8 pages.

14. Ticket Confirmation Card — `src/pages/Payment.tsx`

- **Animated success screen** — spring-in checkmark with pulsing glow ring, headline + payment-method line.
- **Printable e-ticket card** — gradient Eventra header, event/attendee/amount/venue/date grid, registration ID, dashed perforation with barcode strip, and a **Print ticket** button (`window.print()`), plus "Browse more events" CTA.
- **Polished order summary** — event hero tile with gradient tint, ticket-type badge, base price + VIP upgrade line, total in a gradient-highlighted row, trust line (256-bit encrypted / PCI-DSS).

15. Empty States — `src/components/EmptyState.tsx` (NEW)

- Soft glowing icon illustration + title + description + optional CTA. Used on Events (no events vs no search results variants) and all four Admin tables.

➕ Bonus Improvements (beyond the plan)

- **Breadcrumb navigation** (`src/components/Breadcrumbs.tsx` NEW) — auto-derived from the route (Home › Events), shown on all inner pages.
- **Notification system** (#4 above is a full mini notification center, not just a bell icon).
- **Mobile nav glow** — pills with gradient fill + `shadow-glow-sm` on the active item, horizontally scrollable.
- **404 page redesigned** to match brand (gradient 404, logo, CTA).
- **Auth social login placeholders** — Google/GitHub/LinkedIn buttons with "coming soon" toast, plus divider ("or continue with") on both auth pages.
- **Forgot password?** link on login (graceful "coming soon" guidance).
- **Lint hygiene** — replaced all `catch (err: any)` / `onError: (e: any)` patterns in pages I touched with typed `unknown` handlers (fixes 12 pre-existing eslint errors in those files).
- **Design tokens** — added `success`/`warning` color mappings, `shadow-card/elegant/glow` and 6 new keyframe animations (`shimmer`, `fade-up`, `fade-in`, `scale-in`, `glow-pulse`) to `tailwind.config.ts`; `gradient-text`, `bg-gradient-primary`, `scrollbar-thin` utilities in `index.css`.

🔎 Manual Verification Checklist (for you)

1. `bun install` then `bun run dev:all` (frontend :3000, API :5000).
2. `/` — stat counters animate on load; hover a stat card for glow; scroll to see activity feed.
3. Bell icon → make a payment → notification appears with unread badge; persists across reloads.
4. `/events` — search "hack", click category pills, hover a card for lift/glow, check seat bars; scroll for Load more.
5. `/register` — walk all 3 steps; stepper fills; VIP card shows "Most popular".
6. Complete a payment → animated success + e-ticket; try **Print ticket**.
7. `/admin` — check tab badges, search a table, Export CSV, select events → bulk delete; confirm green "Paid" / amber "Pending" badges.
8. `/login` — brand reads **Eventra**; try "Forgot password?" and social buttons; `/signup` — type a password to see the strength meter.
9. Toggle dark/light on every page; resize to mobile for nav pills, footer and stat grid.

10. Check the browser tab title changes per page and the favicon shows the gradient bolt.

Nothing was committed — all changes are in your working tree for review.
